TITLE: Effect of certain coatings on the fatigue strength and corrosion-fatigue strength of
Kh17N2 steel 49,55, 14 49,55, 14 49,55, 14

SOURCE: Fiziko-khimicheskaya mekhanika materialov, v. 1, no. 6, 1965, 694-696

TOPIC TAGS: fatigue strength, steel, nickel, cadmium, protective coating, organo-silicon compound, metal property

ABSTRACT: The fatigue strength and corrosion-fatigue strength of hardened and tempered Kh17N2 steel were measured on NU machines after a nickel-cadmium and protective lacquer coatings (302 lacquer and V-58 material, a solution of an organosilicon polymer in toluene with mineral additives) were deposited on its surface. A 3% NaCl solution was used as the corrosion medium. In the latter, the coatings were found to affect considerably the strength of cyclically deformed steel, particularly at high stress amplitudes and

Card 1/2

L 14422-66

ACC NR: AP6002118

2

a small number of cycles. At about 2×10^7 cycles, the best protective effect was shown by the coating of 302 lacquer, but the fatigue strength decreased sharply, owing to a breakdown in the continuity of the coating. The situation was similar in the case of the nickel-cadmium electrodeposit, except that the fatigue limit was lower than with the 302 lacquer. At about 2×10^7 cycles, an extensive attack of the Ni-Cd coating and sharp drop of the limit of corrosion-fatigue strength took place. Deposition of V-58 had practically no effect on the corrosion-fatigue resistance of the steel, owing to the porosity and loose adhesion of this coating. Orig. art. has: 1 figure.

TITLE: Direct complexometric titration of indium using azoderivatives of 8-hydroxyquinoline-5-sulfonic acid as indicators

PERIODICAL: Zhurnal analyticheskoy khimii, v.17, no.4, 1962, 447-456

TEXT: The synthesis of 14 derivatives of the 8-hydroxy-quinoline-5 sulfonic acid was carried out and the possibilities for their use as complexometric indicators was studied. It was found that the following compounds are suitable for complexometric titrations of indium: (a) 7-(1-naphtylazo)-8-hydroxyquinoline-5-sulfonic acid; (b) 7-(4-sulfo-2-naphtylazo)-8-hydroxyquinoline-5-sulfonic acid; (c) 7-(4,8-disulfo-2-naphtylazo)-8-hydroxy-quinoline-5-sulfonic acid; (d) 7-(5,7 disulfo-2-naphtylazo)-8-hydroxyquinoline-5-sulfonic acid. The elementary microanalysis of the constants of solutions were studied and tabulated. The color of the solid salt and of the aqueous solns. at different pH's are given. The pH range of the indicator color change for 30 similar compounds is tabulated. The indium complexes of some of

Card 1/2

107/1217

Direct complexometric...

the above compounds (c) and (d), and also with 7-(5-sulf-2-naphtylazo)-8-hydroxy-quinoline-5-sulfonic acid were studied. Photocolorimetric titrations show that indium reacts with the above reagents to form complexes at the molar ratio 1:1. These new reagents may be used successfully for the complexometric titration of indium ions at pH 2. Mg, Mn, Cd, Zn, Ca and Al in the presence of fluorides do not interfere. Titrations in presence of Al (and fluorides) are carried out in presence of precipitates and some experience is required. There are 4 figures and 5 tables.

Tabisz J. Influence of Harvest time on the fibre yield from Hemp. at Varying Sowing Densities.

Polish Technical
Abst. No. 4, 1953
Agriculture, Food
Processing, Industry,
Forestry, Fisheries

Wplyw Terminu sprzetu na plon wloknia konopi z masy przy roznej gestosci siewu. (Prace Gl. Inst. Wlokn. W.5), Warszawa, 1952, PWT, 17 pp., 3 figs., 17 tabs.

Review of attempts hitherto made to solve the problem of optimum harvest time for hemp. The article is also with differences found in anatomical structure of the hemp stalk. Description of an experimental carried out with hemp supplied by the Central Flax and Hemp Experimental Station. The hemp was harvested at five different times, the density of sowing varying in each case. The general yield of female individuals was highest after 71 days of vegetation, that of male individuals, according to density of sowing--after 70 or 81 days. The total crop of both male and female individuals reached its maximum after 71 days of vegetation. The experiment made it possible to determine the influence of the density of sowing and of harvest time on the quantity and quality of crop.

Tablsz J. Correct Retting of Hemp Straw.

„Prawidłowe roszenie słomy konopnej”. (Prace Inst. Przem. Włókien Lyk. No. 12), Poznań, 1956, 22 pp., 8 tabs.

This publication deals with experiments undertaken with a view to establishing the most suitable conditions for retting hemp straw and to developing instructions for industrial praxis. After examining the effect of various factors on yield and quality of fibre, the following conclusions are reached: 1) retting prolonged up to 153 hours enhances the quality but reduces the yield of fibre; 2) optimum retting temperature is $+35^{\circ}\text{C}$; 3) retting of pressed straw is a longer process by about 20 per cent, but greatly increases (by about 100 per cent) the traffic capacity per basin; 4) total change of water, steam heated in the basin, improves the quality of the fibre — the best results are obtained when the water is changed 6 hours after flooding the basins; 5) ammonium sulphate, added in amount of 1 per cent of the weight of crude straw, most effectively reduces the duration of hemp retting; 6) only slight reduction of retting time is obtained by additions of defecation lime, but the quality of the fibre is enhanced; 7) cutting straw over 120 cm. long, and separate retting of upper and lower parts, yields fibre of enhanced quality.

Thermal Stresses (Cont.)

COVERAGE: The book contains 18 articles dealing with investigations connected with thermal stresses in turbine components. Individual articles discuss thermoelasticity, thermoplasticity, thermal conductivity, and temperature fields. No personalities are mentioned. References accompany 17 articles. The conference recommended broadening the theoretical and experimental investigations of aerothermoelastic and aerothermoplastic problems, the development of investigations of general problems of the theory of thermoelasticity and thermoplasticity based on the thermodynamic principles of reversible and nonreversible processes, the development of effective calculation methods for thermal stresses taking into account plastic deformations and creep in thin- and thick-walled structural members under stationary and nonstationary operating conditions, the development of experimental-research methods for thermometry and tensiometry in connection with modern operational conditions of mechanical structures, and the broadening of investigations of problems in the thermostrength of structures, especially of those operating under conditions of frequent and sharp temperature changes.

TITLE: Magnetoresistance of bismuth in fields up to 450 kOe at helium temperatures

SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki. Pis'ma v redaktsiyu. Prilozheniye v. 4, no. 1, 1966, 27-32

TOPIC TAGS: bismuth, magnetoresistance, electric resistance, pulsed magnetic field, glavanomagnetic effect, carrier density, semiconductor carrier

ABSTRACT: Results are reported of an investigation of the electric resistance of single-crystal samples of bismuth in a transverse magnetic field of intensity up to 450 kOe at liquid-helium temperature, with primary purpose of obtaining information on the character of the carrier dispersion in bismuth. Earlier investigations at helium temperatures were made at lower field strengths (up to 100 kOe). The magnetic field was produced by a pulse method and the difficulty connected with the destruction of the sample by interaction between the eddy currents and the field was eliminated by superimposing a constant field on the pulsed one. Samples of different shapes and different thermal coefficients of resistivity were tested. In all cases the plots showed a monotonic increase of the magnetoresistance with the field, following a quadratic law up to 25 - 35 kOe, nearly linear from 25 - 35 to 200 kOe, followed by

Card 1/2

L 36247-00

ACC NR: AP6023637

saturation at 200 - 400 kOe, and then by a decrease. Superimposed on the monotonic component are clearly pronounced Shubnikov - deHaas magnetoresistance oscillations, but without the periodicity in the reciprocal field normally observed in weak fields. The results are interpreted as being due to non-quadratic dispersion of the electrons and to a linear increase in the carrier density with increasing field, but definite conclusions call for additional experiments in very strong fields. The authors thank M. Ya. Azbel' for a discussion, A. I. Shal'nikov for interest in the work, N. L. Shofman, T. V. Gorskaya, and A. N. Radionova for help with the measurements, and senior machinist A. P. Popov for high-grade mechanical work. Orig. art. has: 3 figures.

ABSTRACT: A design diagram consisting of a thermal shielding, the vessel of a water-moderated water cooled reactor and primary shielding water were examined with a view to determining the relationship between the heat-release in a reactor vessel and the iron-water composition of the thermal shielding. An electronic computer was used to calculate the space-energy distribution of the neutron fluxes, according to a seven-group scheme proposed by (D. L. Broder, etc., Atomnaya Energiya, 12, 129 (1962)), in order to determine the distribution function of the neutron capture density. The calculated

Card 1/52

ACCESSION NR: AP4006633

distribution magnitudes of the specific heat release from an iron plate are represented in the enclosure, Fig. 2, and the various components of the heat release, as determined by the iron concentration as shown in the enclosure, Fig. 3. When the iron concentration in the thermal shielding is low, the heat release is occasioned primarily by the gamma-radiation from the reactor core. The heat release components, determined by the absorption of capture gamma-radiation, decrease with the increasing iron content in the thermal shielding to 65-70%, and then increase again. This is due to the changing absorptive properties of the iron-water shielding in relation to neutrons. The minimum heat release corresponds to 70% volume concentration of iron in the thermal shielding.

"The authors are grateful to D. L. Broder for his interest in this project, and to I. A. Kulikova and Ye. A. Pavlova for programming the multigroup calculations."

AUTHOR: Tábor, Michály

TITLE: Automatic breaker with magnetic amplification producing pulsed electrical energy

PERIODICAL: Referativnyy zhurnal. Avtomatika i radioelektronika, no. 6, 1962, abstract 6-8-49 p (Hungarian pat., kl. 74 d, 8-10, no. 146645, 15.05.60)

TEXT: The service given by mechanical interruptors is often inadequate, their life being limited by wear and contact burning. An electrical method of circuit breaking is proposed, employing a self-excited generator of a frequency 1 to 5 c/s operating as a magnetic amplifier; a full-wave rectifier is connected into the feedback circuit of the generator. The circuit diagram of the breaker is presented in the figure. [Abstracter's note: Complete translation.]

"Clinical Aspect of Pneumonia in Childhood."

Belgrade, Srpski Arhiv za Tselokupno Lekarstvo, Vol 93, No 4, Apr 1965;
pp 353-362.

Abstract [English summary modified]: Data on 190 children with pneumonia
treated over the last 3 years; most were admitted with tentative diagnosis
of tuberculosis. Of the 190, the microbial (including viral pathogenesis)
was determined in 50. Diagnostic, clinical, roentgenographic and serologic
data are tabulated and discussed. 5 tables, 3 Yugoslav references
including unpublished data; 1 British; manuscript received 30 Apr 64.

USSR/Medicine - Nerve Block

"The Scientific Legacy of A. V. Vishnevskiy," M. G. Talorisskiy, Cand Med Sci, Stanislay, Ukrainian. 1975

"Khirurgiya" No 13, pp 73-75

Describes experience in applying Vishnevskiy's technique of "creeping infiltration" in establishing local anesthesia with novocain; successful treatment of a dense submaxillary infiltrate by a novocain block in the kidney area; application of paranephral blocking in the treatment of periodontites, acute inflammatory conditions on the face and scalp, furuncles of the neck, early stages of phlegmons, post-traumatic orchiepididymites, hematomata which resulted from a blow and diffuse with difficulty, etc. States that Vishnevskiy's method of paranephral blockade and other methods of novocain blocking devised by him have been widely adopted into USSR medical practice. Describes application of novocain block for differential diagnosis of intestinal blockin (on the basis of G. A. Rikhter's work at Vishnevskiy's clinic), also application of Vishnevskiy's method for the treatment of old pleural empyemas and Vishnevskiy's vaginossympathetic cervical block for the treatment of chest wounds.

TITLE: An Experimental Study of Amplification of Light Using a Device Consisting of a Photoresistor, a Ferroelectric and an Electroluminescent Phosphor

PERIODICAL: Optika i spektroskopiya, 1960, Vol.9, No.5, pp 626-630

TEXT: The authors describe the circuit (Fig.1) and the performance of an electroluminescent image (light) amplifier in which a phosphor (ZnS, with green electroluminescence, shown as C_3 in Fig.1) is connected in series with a ferroelectric (a monocrystal of triglycine sulphate, C_0). The phosphor and the ferroelectric act as capacitors. In parallel with them there is a photoresistor (made of CdS powder, R_0), which receives the incident light. Fig. 1a gives the actual circuit (similar to dielectric amplifier circuits) and Fig. 1 gives the equivalent circuit; U_m is an a.c. source, V is a d.c. source, R_a is an ohmic resistance and C_3 is a linear capacitance. Figs 2 and 3 show the phosphor emission brightness as a function of a constant bias across the ferroelectric (Fig. 2) and as a function of

TITLE: Experimental study of the possibility of producing multi-
component electroluminescent apparatus using ferroelectric
materials.

PERIODICAL: Izvestiya Akademiya Nauk SSSR Seriya fizicheskaya, v. 25,
no. 1, 1961, 193-200

TEXT: The present paper has been read at the 9th Conference on Luminescence
(Crystal Phosphors), Kiev, June 20-25, 1960. The authors studied
apparatus for the registration of pictures and for image intensifiers using
photoresistors. They examined the possibility of applying ferro-
electric materials (large crystals of triglycine sulfate and ferroelectric
ceramics of the type "Varikrit") for electroluminescent apparatus.
Circuits for the measurement of the characteristics of ferroelectric
materials are presented in Fig. 1. The diagrams constructed therewith are
shown in Figs. 2, 3, and 4. The "storing effect" arising with larger

Amplitudes of the control signal may be seen from the diagram of Fig. 4. As is shown by it, the depolarization curve does not coincide with the polarization curve of the ferroelectric material. A loop is formed, whose width is the largest, the larger the control signal amplitude. In the authors' opinion, it is quite possible that an accurate study may show this "watering effect" to be useful for the production of apparatus with information storage; circuits of this kind could then be considerably simplified. Fig. 5 presents a circuit for the reproduction of images, which is free from the deficiencies of the circuit shown in Fig. 4a (precise and durable storage of the capacity of the ferroelectric material; no disturbance of the control signal, thanks to separation of the alternating-current circuit from the control circuit; no negative feedback between control voltage and brightness of the electroluminescence). Fig. 5 presents the scheme of a multicomponent apparatus in which, using a nonlinear resistor or a thin layer, we may work out a compact screen, to which all of its elements are connected already in the course of production. Fig. 6 illustrates a circuit of a light amplifier, for which a ferroelectric material is used. Here, the photoreceptor is connected to a direct-current circuit, whereby its sensitivity is

augmented compared with the usual RC voltage divider circuits. Moreover, as it does not serve for transmitting the exciting power to the electro-luminophore, the frequency is not restricted by it. There are 6 figures and 10 references: 6 Soviet-bloc and 4 non-Soviet-bloc.

TITLE: Problems involved in the development of electroluminescent indicators and image converters / Report, Fourteenth Conference on Luminescence held in Riga, 16-23 September 1965/ 25

SOURCE: AN SSSR. Izvestiya. Seriya fizicheskaya, v. 30, no. 4, 1966, 620-627

TOPIC TAGS: real time data display, image converter, electroluminescence, *phosphors, information storage and retrieval, control circuit*

ABSTRACT: The paper is devoted to a general discussion of the problems involved in development of electroluminescent display screens (matrix screens) and electroluminescent converters of visible and x-ray images. In conjunction with the screens it is indicated that current research is aimed at increasing the peak brightness of electroluminescent phosphors (important because the average viewing brightness is a function of the maximum brightness multiplied by the excitation time of a screen element and divided by the interval between successive activations) and development of means for realization of information storage on or for the screen. Approaches to enhancement of brightness are improvement of the composition of phosphors and electroforming, which involves application of an ac or dc potential to the electroluminescent 2-

capacitor while the binder (paraffin) is solidifying. Realization of storage is connected with development of appropriate control circuitry, including external storage components. A block diagram of a control circuit for a matrix screen with external storage is shown in a figure. Research in the field of image converters is being carried out along the lines of improving the parameters of photoconducting powdered materials in the visible and x-ray regions, theoretical and experimental determination of the optimum operating conditions for converters of different design, design development and improvement of the technology of image converters. A table gives a series of formulas that should be useful in designing new image converters. Mention is made of work on development of tubes for converting ultrasonic images to visible images. Photographs reproduced in the text show a converter image of a TV test pattern and images of x-ray pictures of some vacuum tubes and electronic components displayed on a 200 cm² screen. Orig. art. has: 14 formulas and 5 figures.
